|---|---|
| **Student** | Feras Saifaddin Ismail Mohammed |
| **Registration number** | 25/27916 |
| **Verification code** | MOB-A2-7916 |
| **App name** | MFPortfolio (M + F = Mohammed Feras) |
| **Android package** | rw.ac.ines.ug2527916.mfportfolio |
| **Programme** | Bachelor's Degree in Software Engineering, INES Ruhengeri |
| **Course** | SWE 3409 Mobile Application Development |
| **Technology** | React Native, Expo, TypeScript, React Navigation, AsyncStorage |

### Concept

MFPortfolio is a small Android app that replaces a paper CV. A recruiter installs the APK and understands who I am, what I can do and what I have built within two minutes. It works offline and keeps my profile on the device.

### Intended recruiter

An internship coordinator or small software company in Rwanda. They are likely to view the app on a phone in a meeting, possibly without reliable internet. They need the name, headline, skills, education and projects quickly, with minimal tapping.

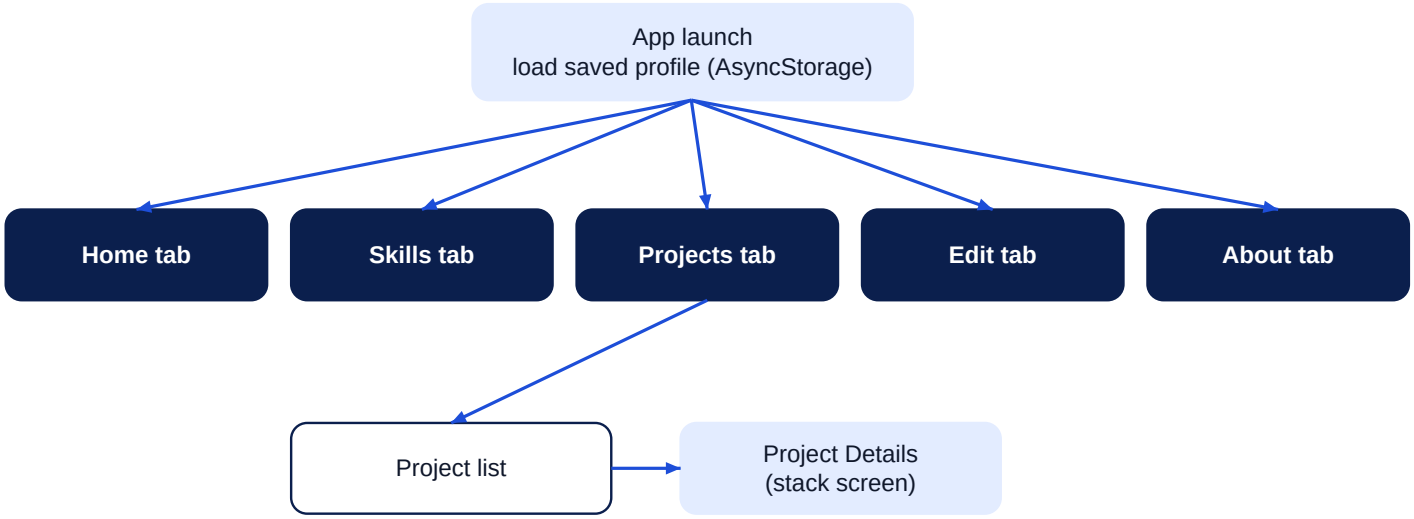
### Visual direction

Blue and white. Deep navy (#0B1F4D) for the header and identity block gives a clear, professional first impression. Royal blue (#1D4ED8) marks actions and the active tab. White cards on a pale blue background keep text easy to read. Layout is simple, single column, with large touch targets.

### Main design decisions

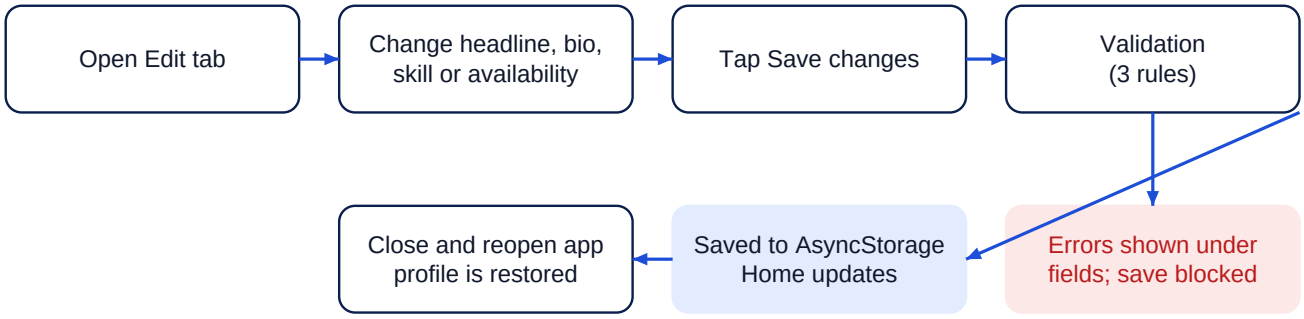
The 'My name is...' sentence is the first and largest text on the Home screen. Everything else is grouped into short cards. Navigation uses five bottom tabs, and the only deeper screen is Project Details. Editing the profile is on its own tab, so the portfolio screens stay clean for the recruiter.

## Navigation structure



Android Back returns to the list; the tab and session stay as they were.

## Profile editing, media and saved-state flow



## Photo flow

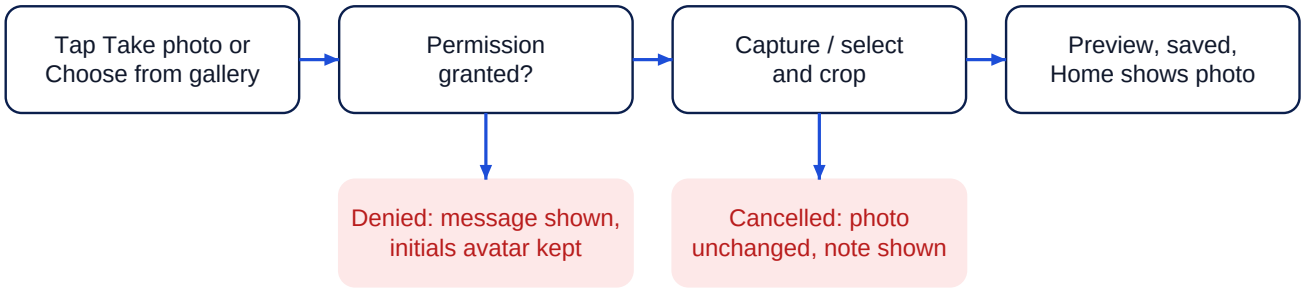


Photo can be replaced from the same buttons, or removed with Remove photo. The reset button on the Edit tab deletes the saved profile and restores the defaults. All data stays on the device, so every screen works in Airplane Mode.

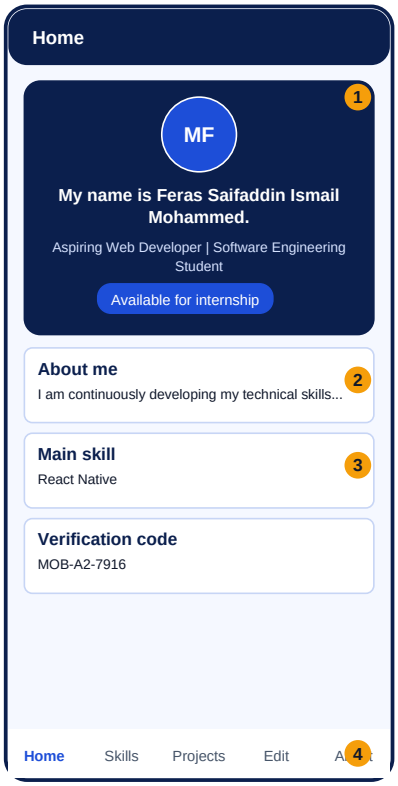
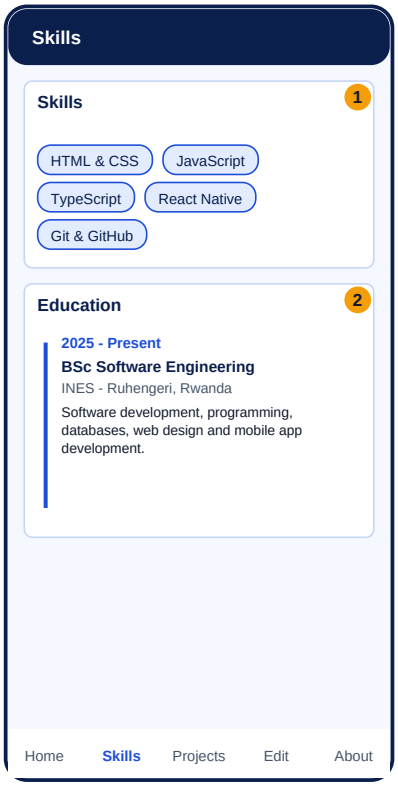
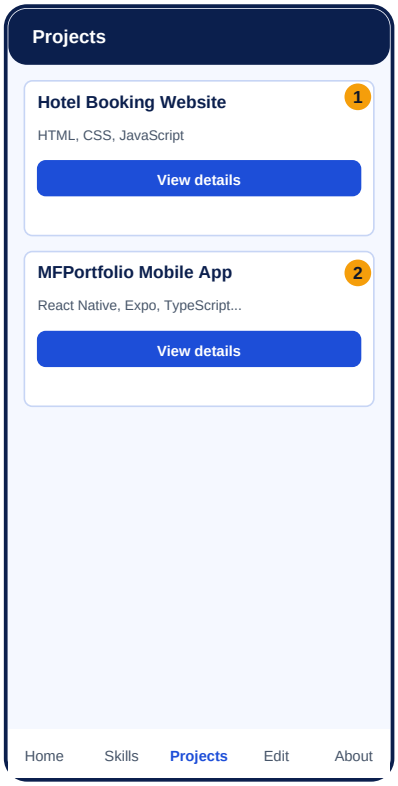
# 3. Wireframes: Home, Skills, Projects, Project Details



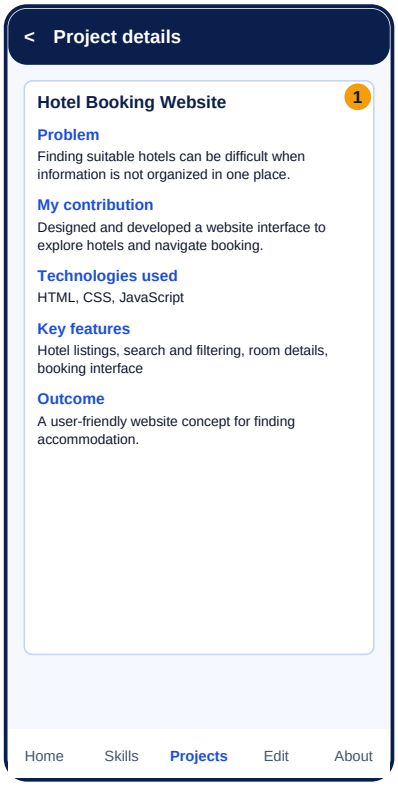
1. Exact 'My name is...' sentence is the first and largest text, with avatar or photo, headline and availability.
2. Short biography card, no scrolling needed for the key facts.
3. Verification code MOB-A2-7916 shown in its own card.
4. Active tab uses royal blue; bottom tabs stay visible.



1. Five skills as wrapping chips (reusable Chip component).
2. Education timeline with a left rule; one entry now, more can be added.
3. Chips wrap, so large system text does not cut content.

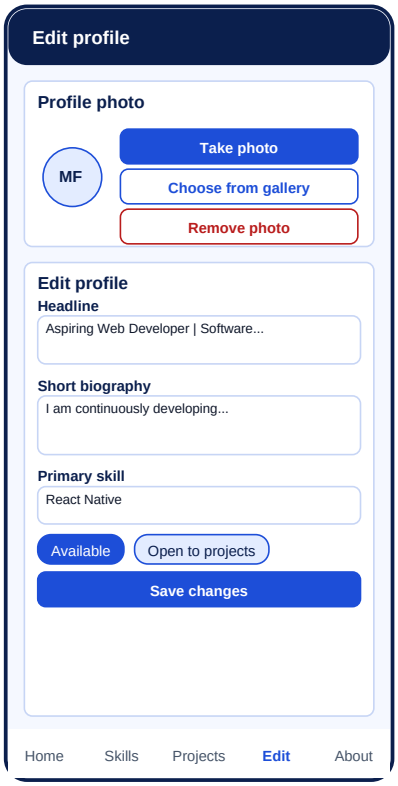


1. Project card: title and technologies only, to keep the list short.
2. View details opens the stack screen and passes the project id.
3. Two projects: Hotel Booking Website and this app.

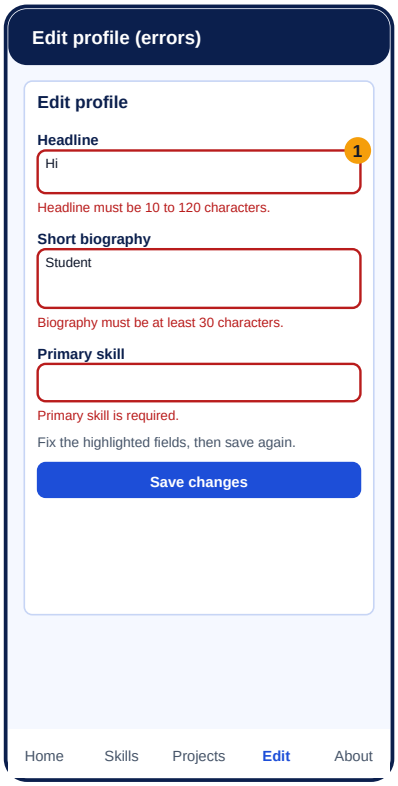


1. Back arrow in the header; Android Back also returns to the list.
2. Headings follow the brief: problem, contribution, technology, features, outcome.
3. Long text scrolls inside the card.

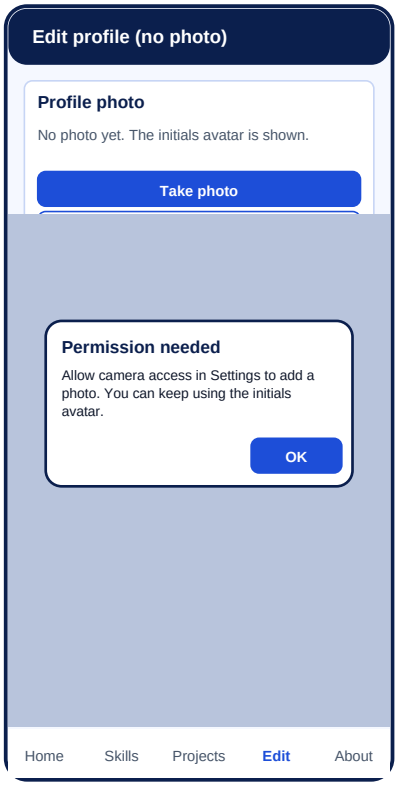
# 4. Wireframes: Profile Editor, error state, empty state, About



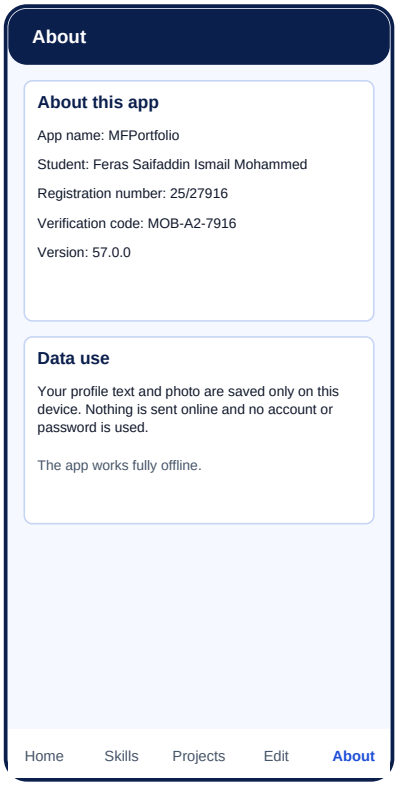
1. Photo card: preview, Take photo, Choose from gallery (replace), Remove photo.
2. Controlled fields with visible labels.
3. Availability chips: one choice at a time.
4. Save changes and Reset profile (resets to defaults).



1. Rule 1: headline 10 to 120 characters.
2. Rule 2: biography 30 to 300 characters.
3. Rule 3: primary skill required, 2 to 30 letters or numbers.
4. Red border and message under each field; saving is blocked.



1. Empty state explains what is shown instead and what to do.
2. Permission denied: plain message, no crash, avatar kept.
3. Cancelled picker: note 'No photo selected. Your current photo is unchanged.'



1. Release information required by the brief.
2. Short data-use statement; nothing sensitive is stored.
3. States clearly that no feature needs internet.

## Colour palette

**Navy #0B1F4D**
Header, identity block

**Royal blue #1D4ED8**
Buttons, active tab

**Pale blue #F5F8FF**
Screen background

**Soft blue #E3ECFF**
Chips, table labels

**White #FFFFFF**
Cards

**Red #B91C1C**
Errors only

## Contrast

- Main text #0F172A on white or #F5F8FF is very high contrast (above 15:1).
- White text on navy #0B1F4D and on royal blue #1D4ED8 is above 4.5:1 (about 15:1 and 6.7:1).
- Error text #B91C1C on white is above 4.5:1 and is always paired with a red border and a written message, so colour is never the only signal.

## Typography

- System sans-serif font (Roboto on Android), so text is familiar and renders offline.
- Scale: 22 px bold for the name sentence, 18 px bold card titles, 15 px body text with 22 px line height, 14 px field labels.
- Short line lengths, left-aligned body text, centred only in the identity block.

## Spacing and layout

- Spacing steps of 8, 16 and 24 px. Cards have 16 px padding and 14 px rounded corners.
- Single-column Flexbox layout inside scrolling screens, so a narrow Android phone never scrolls sideways.
- Skill chips and availability chips wrap onto new lines instead of shrinking.

## Accessibility

- Buttons and fields are at least 44 px high. Tab labels are visible text, not icons only.
- Every button has an accessible label and role; the profile photo and avatar have descriptive labels; headings use the header role.
- Validation messages are announced politely by screen readers (live region).
- Large-text behaviour: text is not given fixed heights, so it grows with the system font size; the screens scroll, and I test with the largest Android font size.

## Offline and privacy

- No network features. The brief's rule about low-risk data is respected: no passwords or tokens are stored.

*Wireframes show the planned layout. Final screenshots of the installed app will be compared with them in the demo video and test log.*
